

OpcNamePath Members

Namespace: Opc.UaFx

Assemblies: Opc.UaFx.Advanced.dll, Opc.UaFx.Advanced.dll

The [OpcNamePath](#) type exposes the following members.

Constructors

OpcNamePath(IEnumerable<OpcName>)

Initializes a new instance of the [OpcNamePath](#) class using the [pathElements](#) specified.

C#

```
public OpcNamePath(IEnumerable<OpcName> pathElements)
```

Parameters

[pathElements](#) [IEnumerable<OpcName>](#)

The elements of the new [OpcNamePath](#).

Exceptions

[ArgumentNullException](#)

One of the items in [pathElements](#) is a null reference (Nothing in Visual Basic).

OpcNamePath(IEnumerable<String>)

Initializes a new instance of the [OpcNamePath](#) class using the [pathElements](#) specified.

C#

```
public OpcNamePath(IEnumerable<string> pathElements)
```

Parameters

[pathElements](#) [IEnumerable<String>](#)

The elements of the new [OpcNamePath](#) which are converted to [OpcName](#) instances used by the new instance.

Exceptions

[ArgumentException](#)

One of the items in [pathElements](#) is an empty string.

[ArgumentNullException](#)

One of the items in `pathElements` is a null reference (Nothing in Visual Basic).

OpcNamePath(OpcName[])

Initializes a new instance of the `OpcNamePath` class using the `pathElements` specified.

C#

```
public OpcNamePath(params OpcName[] pathElements)
```

Parameters

`pathElements` `OpcName[]`

The elements of the new `OpcNamePath`.

Exceptions

`ArgumentNullException`

One of the items in `pathElements` is a null reference (Nothing in Visual Basic).

OpcNamePath(String[])

Initializes a new instance of the `OpcNamePath` class using the `pathElements` specified.

C#

```
public OpcNamePath(params string[] pathElements)
```

Parameters

`pathElements` `String[]`

The elements of the new `OpcNamePath` which are converted to `OpcName` instances used by the new instance.

Exceptions

`ArgumentException`

One of the items in `pathElements` is an empty string.

`ArgumentNullException`

One of the items in `pathElements` is a null reference (Nothing in Visual Basic).

Properties

Empty

Gets the default empty path.

C#

```
public static OpcNamePath Empty { get; }
```

Property Value

[OpcNamePath](#)

An instance of the [OpcNamePath](#) which can be used for general purpose in cases there an empty path is enough.

IsEmpty

Gets a value indicating whether the path is empty.

C#

```
public bool IsEmpty { get; }
```

Property Value

[Boolean](#)

The value true if there exist no element in the path; otherwise the value false.

Item[Int32]

Gets the [OpcName](#) at the specified index.

C#

```
public OpcName this[int index] { get; }
```

Property Value

[OpcName](#)

The [OpcName](#) at the specified index.

Exceptions

[ArgumentOutOfRangeException](#)

The `index` is not valid index in the [OpcNamePath](#).

Length

Gets the number of elements contained in the [OpcNamePath](#).

C#

```
public int Length { get; }
```

Property Value

[Int32](#)

The zero-based number of elements.

Methods

Combine(OpcNamePath[])

Combines the [paths](#) specified into one path there its sequence of elements is created from the consecutive elements of the [paths](#) passed.

C#

```
public static OpcNamePath Combine(params OpcNamePath[] paths)
```

Parameters

[paths](#) [OpcNamePath\[\]](#)

The array of [OpcNamePath](#) instances its elements have to be combined to a new [OpcNamePath](#).

Returns

[OpcNamePath](#)

A new instance of the [OpcNamePath](#) class with the elements of the first path followed by the elements of the second path and so on for all other [paths](#) specified.

Exceptions

[ArgumentNullException](#)

The [paths](#) is a null reference (Nothing in Visual Basic).

Remarks

In case there in [paths](#) is a null reference (Nothing in Visual Basic) it will be ignored.

CompareTo(Object)

Compares the current [OpcNamePath](#) with the [other](#).

C#

```
public int CompareTo(object other)
```

Parameters

[other](#) [Object](#)

The [OpcNamePath](#) to compare with this [OpcNamePath](#).

Returns

[Int32](#)

A 32-bit signed integer that indicates the relative order of the objects being compared ([CompareTo\(Object\)](#)).

CompareTo(OpcNamePath)

Compares the current [OpcNamePath](#) with another [OpcNamePath](#).

C#

```
public int CompareTo(OpcNamePath other)
```

Parameters

[other](#) [OpcNamePath](#)

The [OpcNamePath](#) to compare with this [OpcNamePath](#).

Returns

[Int32](#)

A 32-bit signed integer that indicates the relative order of the objects being compared ([CompareTo\(\)](#)).

Contains(OpcNamePath)

Returns a value indicating whether a specified sub-path occurs within this [OpcNamePath](#).

C#

```
public bool Contains(OpcNamePath path)
```

Parameters

[path](#) [OpcNamePath](#)

The [OpcNamePath](#) to seek.

Returns

[Boolean](#)

The value true if [path](#) is a sub-path of this [OpcNamePath](#); otherwise the value false.

Exceptions

[ArgumentNullException](#)

The [path](#) is a null reference (Nothing in Visual Basic).

Equals(Object)

Determines whether the specified [other](#) is equal to this [OpcNamePath](#).

C#

```
public override bool Equals(object other)
```

Parameters

[other](#) [Object](#)

The [OpcNamePath](#) to compare to the current [OpcNamePath](#).

Returns

[Boolean](#)

The value true if the specified [OpcNamePath](#) is equal to the current [OpcNamePath](#); otherwise the value false.

Equals(OpcNamePath)

Determines whether the specified [other](#) is equal to this [OpcNamePath](#).

C#

```
public bool Equals(OpcNamePath other)
```

Parameters

[other](#) [OpcNamePath](#)

The [OpcNamePath](#) to compare to the current [OpcNamePath](#).

Returns

Boolean

The value true if the specified [OpcNamePath](#) is equal to the current [OpcNamePath](#); otherwise the value false.

GetHashCode()

Retrieves a hash code for this [OpcNamePath](#).

C#

```
public override int GetHashCode()
```

Returns

Int32

An [Int32](#) that contains the hash code for the [OpcNamePath](#).

Parse(String)

Converts a path string to a [OpcNamePath](#) instance.

C#

```
public static OpcNamePath Parse(string value)
```

Parameters

value String

A string that contains a path.

Returns

OpcNamePath

An instance of the [OpcNamePath](#) class.

Exceptions

FormatException

The `value` is not a valid path.

ToArray()

Copies the elements of the path to a new array of [OpcName](#) instances.

C#

```
public OpcName[] ToArray()
```

Returns

OpcName[]

An array of OpcName instances representing the elements of the path.

ToString()

Returns a string representing the path.

C#

```
public override string ToString()
```

Returns

String

A string formatted with the elements of the path.

TryParse(String, out OpcNamePath)

Determines whether a string is a valid path.

C#

```
public static bool TryParse(string value, out OpcNamePath path)
```

Parameters

value String

The string to validate.

path OpcNamePath

The OpcNamePath version of the string.

Returns

Boolean

The value true, if value is a valid path; otherwise the value false.

Operators

Equality(OpcNamePath, OpcNamePath)

Returns a value indicating whether two instance of [OpcNamePath](#) are equal.

C#

```
public static bool operator ==(OpcNamePath left, OpcNamePath right)
```

GreaterThan(OpcNamePath, OpcNamePath)

Determines whether the first specified [OpcNamePath](#) object is greater than the second specified [OpcNamePath](#) object.

C#

```
public static bool operator >(OpcNamePath left, OpcNamePath right)
```

GreaterThanOrEqual(OpcNamePath, OpcNamePath)

Determines whether the first specified [OpcNamePath](#) object is greater than or equal to the second specified [OpcNamePath](#) object.

C#

```
public static bool operator >=(OpcNamePath left, OpcNamePath right)
```

Implicit(OpcName to OpcNamePath)

Creates a new instance of the [OpcNamePath](#) from the **value** specified.

C#

```
public static implicit operator OpcNamePath(OpcName value)
```

Implicit(String to OpcNamePath)

Converts a [String](#) to an [OpcNamePath](#) object.

C#

```
public static implicit operator OpcNamePath(string value)
```

Inequality(OpcNamePath, OpcNamePath)

Returns a value indicating whether two instances of [OpcNamePath](#) are not equal.

C#

```
public static bool operator !=(OpcNamePath left, OpcNamePath right)
```

LessThan(OpcNamePath, OpcNamePath)

Determines whether the first specified [OpcNamePath](#) object is less than the second specified [OpcNamePath](#) object.

C#

```
public static bool operator <(OpcNamePath left, OpcNamePath right)
```

Exceptions

[ArgumentNullException](#)

The [left](#) is a null reference (Nothing in Visual Basic).

LessThanOrEqual(OpcNamePath, OpcNamePath)

Determines whether the first specified [OpcNamePath](#) object is less than or equal to the second [OpcNamePath](#) object.

C#

```
public static bool operator <=(OpcNamePath left, OpcNamePath right)
```

Exceptions

[ArgumentNullException](#)

The [left](#) is a null reference (Nothing in Visual Basic).
