

# PlcType Members

**Namespace:** IPS7Lnk.Advanced

**Assemblies:** IPS7LnkNet.Advanced.dll, IPS7LnkNet.Advanced.dll

The [PlcType](#) type exposes the following members.

## Fields

### MaxLength

Specifies the maximum value that can be used for the [Length](#) property.

**C#**

```
public const int MaxLength = 65535
```

**Field Value**

[Int32](#)

### MinLength

Specifies the minimum value that can be used for the [Length](#) property.

**C#**

```
public const int MinLength =
```

**Field Value**

[Int32](#)

## Properties

### Address

Gets the start address of the [PlcType](#) in the PLC.

**C#**

```
public PlcAddress Address { get; }
```

**Property Value**

[PlcAddress](#)

The [PlcAddress](#) used as the start address of the [PlcType](#) at which data of the type represented is stored

within the PLC.

## Remarks

The value of this property is a null reference (Nothing in Visual Basic) in cases there the [PlcType](#) is relative (see [IsAbsolute](#)).

## DefaultValue

Gets the type dependent default value which can be assigned to an entity of the type represented.

### C#

```
public virtual object DefaultValue { get; }
```

## Property Value

[Object](#)

The type dependent default value.

## Description

Gets or sets more meaningful information about the type and its usage than only using the [Name](#) property.

### C#

```
public string Description { get; set; }
```

## Property Value

[String](#)

A [String](#) value containing additional information about the type and its usage.

## EndAddress

Gets the end address of the [PlcType](#) in the PLC.

### C#

```
public PlcAddress EndAddress { get; }
```

## Property Value

[PlcAddress](#)

The [PlcAddress](#) used as the end address of the [PlcType](#) at which the data associated with the type represented ends within the PLC.

## Remarks

The value of this property is a null reference (Nothing in Visual Basic) in cases there the [PlcType](#) is relative (see [IsAbsolute](#)).

The [PlcAddress](#) provided by this property does represent the inclusive address of the type represented.

## FrameworkType

Gets the concrete .NET framework type used when working with the [PlcType](#).

### C#

```
public Type FrameworkType { get; }
```

## Property Value

[Type](#)

The concrete [Type](#) used when working with the [PlcType](#).

## HasElementType

Gets a value indicating whether the current [PlcType](#) encompasses another type this is the case when the current [PlcType](#) is an array.

### C#

```
public bool HasElementType { get; }
```

## Property Value

[Boolean](#)

The value true if the [PlcType](#) is an array; otherwise the value false.

## Identity

Gets the identity of the [PlcType](#) in the PLC.

### C#

```
public PlcIdentity Identity { get; }
```

## Property Value

[PlcIdentity](#)

The [PlcIdentity](#) used to identify the PLC resource associated with the [PlcType](#).

# IsAbsolute

Gets a value indicating whether the [PlcType](#) does absolutely refer to a PLC resource.

## C#

```
public bool IsAbsolute { get; }
```

## Property Value

[Boolean](#)

The value true, if the [PlcType](#) does refer by its [Identity](#) to a absolute PLC resource; otherwise the value false.

## Remarks

If [Address](#) isn't a null reference (Nothing in Visual Basic) in general [IsAbsolute](#) will always return the value true. In cases there the [Identity](#) is an instance of the [PlcOperand](#) class the property will return also the value true if the [Type](#) is equals [DataBlock](#).

# IsArray

Gets a value indicating whether the framework [Type](#) of the [PlcType](#) is an array.

## C#

```
public bool IsArray { get; }
```

## Property Value

[Boolean](#)

The value true, if the framework [Type](#) is an array; otherwise the value false.

# IsClass

Gets a value indicating whether the framework [Type](#) of the [PlcType](#) is a class; that is, not a value type or interface.

## C#

```
public bool IsClass { get; }
```

## Property Value

[Boolean](#)

The value true, if the framework [Type](#) is a class; otherwise the value false.

# Layout

Gets the characteristics to use when aligning the [Members](#) of the [PlcType](#).

**C#**

```
public PlcTypeLayout Layout { get; }
```

## Property Value

[PlcTypeLayout](#)

An instance of the [PlcTypeLayout](#) class to align the [Members](#).

# Length

Gets a 32-bit integer that represents the total number of elements that can be stored in a value of the type.

**C#**

```
public int Length { get; }
```

## Property Value

[Int32](#)

A 32-bit integer that represents the total number of elements that can be stored in a value of the type.

# Members

Gets the members associated with the PLC type.

**C#**

```
public IPlcMemberInfo[] Members { get; }
```

## Property Value

[IPlcMemberInfo\[\]](#)

An array of [IPlcMemberInfo](#) objects.

# Name

Gets the name of the PLC type represented.

**C#**

```
public PlcName Name { get; }
```

## Property Value

### PlcName

The name of the PLC type.

## RelativeType

Gets the [PlcType](#) from that this [PlcType](#) has been absolutely defined.

### C#

```
public PlcType RelativeType { get; }
```

## Property Value

### PlcType

An instance of the [PlcType](#) class, if this [PlcType](#) has been originally defined by a non-absolute type declaration.

## Size

Gets a 32-bit integer that represents the total number of bytes required to store a value of the type within the PLC memory.

### C#

```
public int Size { get; }
```

## Property Value

### Int32

A 32-bit integer that represents the total number of bytes required to store a value of the type within the PLC memory.

## SizeInBits

Gets a 32-bit integer that represents the total number of bits required to store a value of the type within the PLC memory.

### C#

```
public int SizeInBits { get; }
```

## Property Value

### Int32

A 32-bit integer that represents the total number of bits required to store a value of the type within the PLC memory.

# TypeCode

Gets the [PlcTypeCode](#) of the PLC type represented.

## C#

```
public PlcTypeCode TypeCode { get; }
```

## Property Value

### [PlcTypeCode](#)

One of members defined by the [PlcTypeCode](#) enumeration. Which defines the concrete type representation in a PLC device.

# Methods

## CreateEntity()

Creates a new [IPlcEntity](#) object which represents a concrete accessible entity of this [PlcType](#).

## C#

```
public virtual IPlcEntity CreateEntity()
```

## Returns

### [IPlcEntity](#)

An instance implementing the [IPlcEntity](#) interface its [Type](#) property does refer to this [PlcType](#).

## Exceptions

### [NotSupportedException](#)

This pure [PlcType](#) instance can't create an entity, because it is an abstract type representation.

## Equals(Object)

Determines whether the specified [other](#) is equal to this [PlcType](#).

## C#

```
public override bool Equals(object other)
```

## Parameters

[other](#) [Object](#)

The [PlcType](#) to compare to the current [PlcType](#).

## Returns

[Boolean](#)

The value true if the specified [PlcType](#) is equal to the current [PlcType](#); otherwise the value false.

# Equals(PlcType)

Determines whether the specified [other](#) is equal to this [PlcType](#).

## C#

```
public bool Equals(PlcType other)
```

## Parameters

[other](#) [PlcType](#)

The [PlcType](#) to compare to the current [PlcType](#).

## Returns

[Boolean](#)

The value true if the specified [PlcType](#) is equal to the current [PlcType](#); otherwise the value false.

# GetElementType(Int32)

Retrieves the [PlcType](#) object encompassed or referred to by the current array type.

## C#

```
public PlcType GetElementType(int index)
```

## Parameters

[index](#) [Int32](#)

The zero based index of the element type to requested.

## Returns

[PlcType](#)

The [PlcType](#) of the object encompassed or referred to by the current array or a null reference (Nothing in Visual Basic) if the current [PlcType](#) is not an array type.

## Exceptions

## ArgumentOutOfRangeException

The `index` is outside the bounds defined by the `MinLength` and `Length`.

## GetHashCode()

Retrieves a hash code for this `PlcType`.

### C#

```
public override int GetHashCode()
```

### Returns

`Int32`

An `Int32` that contains the hash code for the `PlcType`.

## GetRawType(PlcTypeCode)

Retrieves the according `PlcRawType` for the `typeCode` specified.

### C#

```
public static PlcRawType GetRawType(PlcTypeCode typeCode)
```

### Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` for that the `PlcRawType` is to be determined.

### Returns

`PlcRawType`

The according `PlcRawType` for `typeCode`.

## GetRawType(Type)

Retrieves the according `PlcRawType` for the `type` specified.

### C#

```
public static PlcRawType GetRawType(Type type)
```

### Parameters

`type` `Type`

The `Type` for that the `PlcRawType` is to be determined.

## Returns

### PlcRawType

The according `PlcRawType` for `type`.

## Exceptions

### ArgumentNullException

The `type` is a null reference (Nothing in Visual Basic).

## GetSize(PlcRawType)

Retrieves the according size for the `rawType` specified.

### C#

```
public static int GetSize(PlcRawType rawType)
```

## Parameters

### `rawType` PlcRawType

The `PlcRawType` for that the size is to be determined.

## Returns

### Int32

The according size (in bytes) for `rawType`.

## GetSize(PlcRawType, Boolean)

Retrieves the according size (optionally in bytes or bits) for the `rawType` specified.

### C#

```
public static int GetSize(PlcRawType rawType, bool inBytes)
```

## Parameters

### `rawType` PlcRawType

The `PlcRawType` for that the size is to be determined.

### `inBytes` Boolean

The value true, to retrieve the size of `rawType` in bytes; otherwise the value false to retrieve the size in bits.

## Returns

Int32

The according size either in bytes or in bits for `rawType`.

## GetSize(PlcTypeCode)

Retrieves the according size for the `typeCode` specified.

### C#

```
public static int GetSize(PlcTypeCode typeCode)
```

## Parameters

`typeCode` PlcTypeCode

The `PlcRawType` for that the size is to be determined.

## Returns

Int32

The according size (in bytes) for `typeCode`.

## GetSize(PlcTypeCode, Boolean)

Retrieves the according size (optionally in bytes or bits) for the `typeCode` specified.

### C#

```
public static int GetSize(PlcTypeCode typeCode, bool inBytes)
```

## Parameters

`typeCode` PlcTypeCode

The `PlcTypeCode` for that the size is to be determined.

`inBytes` Boolean

The value true, to retrieve the size of `typeCode` in bytes; otherwise the value false to retrieve the size in bits.

## Returns

Int32

The according size either in bytes or in bits for `typeCode`.

# GetSize(Type)

Retrieves the according size for the `type` specified.

## C#

```
public static int GetSize(Type type)
```

## Parameters

`type` Type

The `Type` for that the size is to be determined.

## Returns

Int32

The according size (in bytes) for `type`.

## Exceptions

ArgumentNullException

The `type` is a null reference (Nothing in Visual Basic).

# GetSize(Type, Boolean)

Retrieves the according size (optionally in bytes or bits) for the `type` specified.

## C#

```
public static int GetSize(Type type, bool inBytes)
```

## Parameters

`type` Type

The `Type` for that the size is to be determined.

`inBytes` Boolean

The value true, to retrieve the size of `type` in bytes; otherwise the value false to retrieve the size in bits.

## Returns

Int32

The according size either in bytes or in bits for `type`.

## Exceptions

## ArgumentNullException

The `type` is a null reference (Nothing in Visual Basic).

# GetSupportedRawTypes(PlcTypeCode)

Retrieves the `PlcRawType` members supported by the `PlcTypeCode` specified by `typeCode`.

## C#

```
public static PlcRawType[] GetSupportedRawTypes(PlcTypeCode typeCode)
```

## Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` its supported `PlcRawType` members are to be determined.

## Returns

`PlcRawType[]`

An array of `PlcRawType` members supported by the `typeCode` specified.

## Remarks

Supported raw types means that these `PlcRawType` members can be used to address the PLC memory of such a `PlcTypeCode` by using one of the supported `PlcRawType` members.

# GetSupportedRawTypes(Type)

Retrieves the `PlcRawType` members supported by the `PlcTypeCode` of the `Type` specified by `type`.

## C#

```
public static PlcRawType[] GetSupportedRawTypes(Type type)
```

## Parameters

`type` `Type`

The `Type` its `PlcTypeCode` is to be used to determine the supported `PlcRawType` members.

## Returns

`PlcRawType[]`

An array of `PlcRawType` members supported by the `PlcTypeCode` of the `type` specified.

## Exceptions

## ArgumentNullException

The `type` is a null reference (Nothing in Visual Basic).

### Remarks

Supported raw types means that these `PlcRawType` members can be used to address the PLC memory of such a `PlcTypeCode` (identified by `type`) by using one of the supported `PlcRawType` members.

## GetType(PlcTypeCode)

Retrieves the according framework `Type` for the `typeCode` specified.

### C#

```
public static Type GetType(PlcTypeCode typeCode)
```

### Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` for that the framework `Type` is to be determined.

### Returns

`Type`

The according framework `Type` for `typeCode`.

### Exceptions

`ArgumentException`

The `typeCode` is not supported.

## GetTypeCode(Type)

Retrieves the according `PlcTypeCode` for the framework `Type` specified.

### C#

```
public static PlcTypeCode GetTypeCode(Type type)
```

### Parameters

`type` `Type`

The framework `Type` for that the `PlcTypeCode` is to be determined.

### Returns

## PlcTypeCode

The according `PlcTypeCode` for `type`.

### Exceptions

#### ArgumentException

The `type` is not supported.

#### ArgumentNullException

The `type` is a null reference (Nothing in Visual Basic).

## IsSupported(PlcTypeCode, PlcRawType)

Determines whether the specified `rawType` can be used to address the PLC memory to access data of the `PlcTypeCode` specified by `typeCode`.

### C#

```
public static bool IsSupported(PlcTypeCode typeCode, PlcRawType rawType)
```

### Parameters

#### `typeCode` `PlcTypeCode`

The `PlcTypeCode` its supported raw types are inspected to determine the accessibility of the PLC memory for such PLC data using the `PlcRawType` specified by `rawType`.

#### `rawType` `PlcRawType`

The `PlcRawType` its compatibility to address PLC data of the `PlcTypeCode` defined by `typeCode` is to be inspected.

### Returns

#### Boolean

The value true if the PLC data of the `typeCode` can be accessed using the `PlcRawType` specified by `rawType`; otherwise the value false.

## IsSupportedArrayType(PlcTypeCode)

Determines whether the `PlcTypeCode` specified by `typeCode` can be also used to access the PLC memory by an array of that `PlcTypeCode`.

### C#

```
public static bool IsSupportedArrayType(PlcTypeCode typeCode)
```

### Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` to inspect.

## Returns

`Boolean`

The value true if the PLC memory can be accessed by an array of the `PlcTypeCode` specified by `typeCode`; otherwise the value false.

# MakeAbsoluteType(PlcIdentity)

Retrieves the absolute `PlcType` using the `PlcIdentity` specified by `identity`.

## C#

```
public PlcType MakeAbsoluteType(PlcIdentity identity)
```

## Parameters

`identity` `PlcIdentity`

The `PlcIdentity` to use when the current `PlcType` is a relative type and the absolute type of the `PlcType` is created.

## Returns

`PlcType`

The reference to the current `PlcType` if `IsAbsolute` is equals true; otherwise another (but absolute) `PlcType` with the same type metadata including the `identity` specified.

## Exceptions

`ArgumentException`

The `identity` specified does not provide the necessary information required to address the type of data.

`ArgumentNullException`

The `identity` is a null reference (Nothing in Visual Basic).

# MakeArrayType()

Returns a `PlcType` object representing a one-dimensional array of the current type, with a length of zero.

## C#

```
public PlcType MakeArrayType()
```

## Returns

### PlcType

A [PlcType](#) object representing a one-dimensional array of the current type, with a length of zero.

## Exceptions

### NotSupportedException

The current [PlcType](#) is either already an array type (see [IsArray](#)) which would result into an unsupported jagged array type or the current [PlcType](#) is a PLC type which does not support array types (see [IsSupportedArrayType\(PlcTypeCode\)](#)).

# MakeArrayType(Int32)

Returns a [PlcType](#) object representing an array of the current type, with the specified [length](#).

## C#

```
public PlcType MakeArrayType(int length)
```

## Parameters

### length Int32

The length for the array.

## Returns

### PlcType

An object representing an array of the current type, with the specified [length](#).

## Exceptions

### ArgumentOutOfRangeException

The [length](#) is out of the bounds defined by [MinLength](#) and [MaxLength](#).

### NotSupportedException

The current [PlcType](#) is either already an array type (see [IsArray](#)) which would result into an unsupported jagged array type or the current [PlcType](#) is a PLC type which does not support array types (see [IsSupportedArrayType\(PlcTypeCode\)](#)).

# Of(PlcTypeCode)

Retrieves the according [PlcType](#) which matches the supplied type metadata.

## C#

```
public static PlcType Of(PlcTypeCode typeCode)
```

## Parameters

`typeCode` [PlcTypeCode](#)

The [PlcTypeCode](#) of the PLC type represented by the [PlcType](#).

## Returns

[PlcType](#)

The [PlcType](#) which matches with the characteristics supplied.

## Exceptions

[ArgumentException](#)

The `typeCode` is [Empty](#).

## Remarks

Using this method it is possible to create from all [PlcTypeCode](#) member the according [PlcType](#) for value and object types. In general it is not possible to define [PlcType](#) which represent an array type using this method.

# Of(PlcTypeCode, PlcIdentity)

Retrieves the according [PlcType](#) which matches the supplied type metadata.

## C#

```
public static PlcType Of(PlcTypeCode typeCode, PlcIdentity identity)
```

## Parameters

`typeCode` [PlcTypeCode](#)

The [PlcTypeCode](#) of the PLC type represented by the [PlcType](#).

`identity` [PlcIdentity](#)

The [PlcIdentity](#) to which the [PlcType](#) does refer.

## Returns

[PlcType](#)

The [PlcType](#) which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `typeCode` is `Empty` or the `identity` can not be used together with the `typeCode` specified or `identity` does not provide the necessary information required to address the type of data.

### ArgumentNullException

The `identity` is a null reference (Nothing in Visual Basic).

## Remarks

Using this method it is possible to create from all `PlcTypeCode` member the according `PlcType` for value and object types. In general it is not possible to define `PlcType` which represent an array type using this method.

# Of(PlcTypeCode, PlcIdentity, Int32)

Retrieves the according `PlcType` which matches the supplied type metadata.

## C#

```
public static PlcType Of(PlcTypeCode typeCode, PlcIdentity identity, int length)
```

## Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` of the PLC type represented by the `PlcType`.

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`length` `Int32`

The length of the `PlcType` which either specifies the total number of elements in an array type or the total number of characters in a string type.

## Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `typeCode` is `Empty` or it can not be used together with the `identity` specified or `identity` does not provide the necessary information required to address the type of data.

### ArgumentNullException

The `identity` is a null reference (Nothing in Visual Basic).

### ArgumentOutOfRangeException

The `length` is out of the bounds defined by `MinLength` and `MaxLength` or `MinLength` and `MaxLength`.

### Remarks

This method does always construct array types using the `PlcType`. Therefore it is not possible to use the following `PlcTypeCode` members as the value for `typeCode`: \* `Date`.

- `Time`.
- `TimeOfDay`.
- `S5Time`.
- `DateTime`.
- `Object`.

It is also possible to construct a `PlcType` with the `String` through this method, there `length` does specify the maximum number of characters in the string.

## Of(PlcTypeCode, PlcIdentity, PlcName)

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of(PlcTypeCode typeCode, PlcIdentity identity, PlcName name)
```

### Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` of the PLC type represented by the `PlcType`.

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`name` `PlcName`

The `PlcName` of the `PlcType`.

### Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

### Exceptions

`ArgumentException`

The `typeCode` is `Empty` or the `identity` can not be used together with the `typeCode` specified or `identity`

does not provide the necessary information required to address the type of data.

### ArgumentNullException

The `identity` or `name` is a null reference (Nothing in Visual Basic).

### Remarks

Using this method it is possible to create from all `PlcTypeCode` member the according `PlcType` for value and object types. In general it is not possible to define `PlcType` which represent an array type using this method.

## Of(PlcTypeCode, PlcIdentity, PlcName, Int32)

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of(PlcTypeCode typeCode, PlcIdentity identity, PlcName name, int length)
```

### Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` of the PLC type represented by the `PlcType`.

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`name` `PlcName`

The `PlcName` of the `PlcType`.

`length` `Int32`

The length of the `PlcType` which either specifies the total number of elements in an array type or the total number of characters in a string type.

### Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

### Exceptions

`ArgumentException`

The `typeCode` is `Empty` or it can not be used together with the `identity` specified or `identity` does not provide the necessary information required to address the type of data.

`ArgumentNullException`

The `identity` or `name` is a null reference (Nothing in Visual Basic).

### ArgumentOutOfRangeException

The `length` is out of the bounds defined by `MinLength` and `MaxLength` or `MinLength` and `MaxLength`.

### Remarks

This method does always construct array types using the `PlcType`. Therefore it is not possible to use the following `PlcTypeCode` members as the value for `typeCode`: \* `Date`.

- `Time`.
- `TimeOfDay`.
- `S5Time`.
- `DateTime`.
- `Object`.

It is also possible to construct a `PlcType` with the `String` through this method, there `length` does specify the maximum number of characters in the string.

## Of(PlcTypeCode, PlcIdentity, PlcName, PlcTypeLayout, IEnumerable<IPlcMemberInfo>)

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of(PlcTypeCode typeCode, PlcIdentity identity, PlcName name,
    PlcTypeLayout layout, IEnumerable<IPlcMemberInfo> members)
```

### Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` of the PLC type represented by the `PlcType`.

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`name` `PlcName`

The `PlcName` of the `PlcType`.

`layout` `PlcTypeLayout`

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the `members`.

`members` `IEnumerable<IPlcMemberInfo>`

The `IPlcMemberInfo` objects to associate with the `PlcType`.

### Returns

## PlcType

The **PlcType** which matches with the characteristics supplied.

### Exceptions

#### ArgumentException

The **typeCode** is **Empty** or the **identity** can not be used together with the **typeCode** specified or **identity** does not provide the necessary information required to address the type of data.

#### ArgumentNullException

The **identity** or **name**, **layout** or **members** or one of its items is a null reference (Nothing in Visual Basic).

### Remarks

This method does only construct **PlcType** objects there the **typeCode** is equals **Object**.

## Of(PlcTypeCode, PlcIdentity, PlcName, PlcTypeLayout, IPlcMemberInfo[])

Retrieves the according **PlcType** which matches the supplied type metadata.

### C#

```
public static PlcType Of(PlcTypeCode typeCode, PlcIdentity identity, PlcName name,
    PlcTypeLayout layout, params IPlcMemberInfo[] members)
```

### Parameters

**typeCode** **PlcTypeCode**

The **PlcTypeCode** of the PLC type represented by the **PlcType**.

**identity** **PlcIdentity**

The **PlcIdentity** to which the **PlcType** does refer.

**name** **PlcName**

The **PlcName** of the **PlcType**.

**layout** **PlcTypeLayout**

An instance of the **PlcTypeLayout** class which provides the characteristics to use to absolutely align the **members**.

**members** **IPlcMemberInfo[]**

The **IPlcMemberInfo** objects to associate with the **PlcType**.

### Returns

## PlcType

The **PlcType** which matches with the characteristics supplied.

### Exceptions

#### ArgumentException

The **typeCode** is **Empty** or the **identity** can not be used together with the **typeCode** specified or **identity** does not provide the necessary information required to address the type of data.

#### ArgumentNullException

The **identity**, **name**, **layout** or **members** or one of its items is a null reference (Nothing in Visual Basic).

### Remarks

This method does only construct **PlcType** objects there the **typeCode** is equals **Object**.

## Of(PlcTypeCode, PlcIdentity, PlcTypeLayout, IEnumerable<IPlcMemberInfo>)

Retrieves the according **PlcType** which matches the supplied type metadata.

### C#

```
public static PlcType Of(PlcTypeCode typeCode, PlcIdentity identity, PlcTypeLayout layout,
IEnumerable<IPlcMemberInfo> members)
```

### Parameters

**typeCode** **PlcTypeCode**

The **PlcTypeCode** of the PLC type represented by the **PlcType**.

**identity** **PlcIdentity**

The **PlcIdentity** to which the **PlcType** does refer.

**layout** **PlcTypeLayout**

An instance of the **PlcTypeLayout** class which provides the characteristics to use to absolutely align the **members**.

**members** **IEnumerable<IPlcMemberInfo>**

The **IPlcMemberInfo** objects to associate with the **PlcType**.

### Returns

**PlcType**

The **PlcType** which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `typeCode` is `Empty` or the `identity` can not be used together with the `typeCode` specified or `identity` does not provide the necessary information required to address the type of data.

### ArgumentNullException

The `identity`, `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

## Remarks

This method does only construct `PlcType` objects there the `typeCode` is equals `Object`.

# Of(PlcTypeCode, PlcIdentity, PlcTypeLayout, IPLcMemberInfo[])

Retrieves the according `PlcType` which matches the supplied type metadata.

## C#

```
public static PlcType Of(PlcTypeCode typeCode, PlcIdentity identity, PlcTypeLayout layout,
    params IPLcMemberInfo[] members)
```

## Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` of the PLC type represented by the `PlcType`.

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`layout` `PlcTypeLayout`

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the `members`.

`members` `IPlcMemberInfo[]`

The `IPlcMemberInfo` objects to associate with the `PlcType`.

## Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `typeCode` is `Empty` or the `identity` can not be used together with the `typeCode` specified or `identity` does not provide the necessary information required to address the type of data.

### ArgumentNullException

The `identity`, `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

### Remarks

This method does only construct `PlcType` objects there the `typeCode` is equals `Object`.

## Of(PlcTypeCode, PlcTypeLayout, IEnumerable<IPlcMemberInfo>)

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of(PlcTypeCode typeCode, PlcTypeLayout layout,
IEnumerable<IPlcMemberInfo> members)
```

### Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` of the PLC type represented by the `PlcType`.

`layout` `PlcTypeLayout`

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the `members`.

`members` `IEnumerable<IPlcMemberInfo>`

The `IPlcMemberInfo` objects to associate with the `PlcType`.

### Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

### Exceptions

`ArgumentException`

The `typeCode` is `Empty`.

`ArgumentNullException`

The `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

### Remarks

This method does only construct [PlcType](#) objects there the `typeCode` is equals [Object](#).

## Of(PlcTypeCode, PlcTypeLayout, IPlcMemberInfo[])

Retrieves the according [PlcType](#) which matches the supplied type metadata.

### C#

```
public static PlcType Of(PlcTypeCode typeCode, PlcTypeLayout layout, params IPlcMemberInfo[] members)
```

### Parameters

`typeCode` [PlcTypeCode](#)

The [PlcTypeCode](#) of the PLC type represented by the [PlcType](#).

`layout` [PlcTypeLayout](#)

An instance of the [PlcTypeLayout](#) class which provides the characteristics to use to absolutely align the `members`.

`members` [IPlcMemberInfo\[\]](#)

The [IPlcMemberInfo](#) objects to associate with the [PlcType](#).

### Returns

[PlcType](#)

The [PlcType](#) which matches with the characteristics supplied.

### Exceptions

[ArgumentException](#)

The `typeCode` is [Empty](#).

[ArgumentNullException](#)

The `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

### Remarks

This method does only construct [PlcType](#) objects there the `typeCode` is equals [Object](#).

## Of(PlcTypeCode, Type)

Retrieves the according [PlcType](#) which matches the supplied type metadata.

### C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType)
```

## Parameters

`typeCode` [PlcTypeCode](#)

The [PlcTypeCode](#) of the PLC type represented by the [PlcType](#).

`frameworkType` [Type](#)

The framework [Type](#) represented by the [PlcType](#).

## Returns

[PlcType](#)

The [PlcType](#) which matches with the characteristics supplied.

## Exceptions

[ArgumentException](#)

The `typeCode` is [Empty](#) or `frameworkType` is a not supported framework type or a jagged or multi-dimensional array type.

[ArgumentNullException](#)

The `frameworkType` is a null reference (Nothing in Visual Basic).

# Of(PlcTypeCode, Type, Int32)

Retrieves the according [PlcType](#) which matches the supplied type metadata.

## C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, int length)
```

## Parameters

`typeCode` [PlcTypeCode](#)

The [PlcTypeCode](#) of the PLC type represented by the [PlcType](#).

`frameworkType` [Type](#)

The framework [Type](#) represented by the [PlcType](#).

`length` [Int32](#)

The length of the [PlcType](#) which either specifies the total number of elements in an array type or the total number of characters in a string type.

## Returns

[PlcType](#)

The [PlcType](#) which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `typeCode` is `Empty` or `frameworkType` is a not supported framework type or a jagged or multi-dimensional array type.

### ArgumentNullException

The `frameworkType` is a null reference (Nothing in Visual Basic).

### ArgumentOutOfRangeException

The `length` is out of the bounds defined by `MinLength` and `MaxLength` or `MinLength` and `MaxLength`.

## Of(PlcTypeCode, Type, Int32, PlcTypeLayout, IEnumerable<IPlcMemberInfo>)

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, int length, PlcTypeLayout layout, IEnumerable<IPlcMemberInfo> members)
```

### Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` of the PLC type represented by the `PlcType`.

`frameworkType` `Type`

The framework `Type` represented by the `PlcType`.

`length` `Int32`

The length of the `PlcType` which either specifies the total number of elements in an array type or the total number of characters in a string type.

`layout` `PlcTypeLayout`

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the `members`.

`members` `IEnumerable<IPlcMemberInfo>`

The `IPlcMemberInfo` objects to associate with the `PlcType`.

### Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `typeCode` is `Empty` or `frameworkType` is a not supported framework type or a jagged or multi-dimensional array type.

### ArgumentNullException

The `frameworkType`, `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

### ArgumentOutOfRangeException

The `length` is out of the bounds defined by `MinLength` and `MaxLength` or `MinLength` and `MaxLength`.

## Of(PlcTypeCode, Type, Int32, PlcTypeLayout, IPlcMemberInfo[])

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, int length, PlcTypeLayout layout, params IPlcMemberInfo[] members)
```

## Parameters

### `typeCode` PlcTypeCode

The `PlcTypeCode` of the PLC type represented by the `PlcType`.

### `frameworkType` Type

The framework `Type` represented by the `PlcType`.

### `length` Int32

The length of the `PlcType` which either specifies the total number of elements in an array type or the total number of characters in a string type.

### `layout` PlcTypeLayout

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the `members`.

### `members` IPlcMemberInfo[]

The `IPlcMemberInfo` objects to associate with the `PlcType`.

## Returns

### PlcType

The `PlcType` which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `typeCode` is `Empty` or `frameworkType` is a not supported framework type or a jagged or multi-dimensional array type.

### ArgumentNullException

The `frameworkType`, `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

### ArgumentOutOfRangeException

The `length` is out of the bounds defined by `MinLength` and `MaxLength` or `MinLength` and `MaxLength`.

## Of(PlcTypeCode, Type, PlcIdentity)

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, PlcIdentity identity)
```

## Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` of the PLC type represented by the `PlcType`.

`frameworkType` `Type`

The framework `Type` represented by the `PlcType`.

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

## Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `typeCode` is `Empty` or `frameworkType` is a not supported framework type or a jagged or multi-dimensional array type or `typeCode` / `frameworkType` can not be used together with the `identity` specified or `identity` does not provide the necessary information required to address the type of data.

### ArgumentNullException

The `frameworkType` or `identity` is a null reference (Nothing in Visual Basic).

## Of(PlcTypeCode, Type, PlcIdentity, Int32)

Retrieves the according [PlcType](#) which matches the supplied type metadata.

### C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, PlcIdentity identity, int length)
```

### Parameters

**typeCode** [PlcTypeCode](#)

The [PlcTypeCode](#) of the PLC type represented by the [PlcType](#).

**frameworkType** [Type](#)

The framework [Type](#) represented by the [PlcType](#).

**identity** [PlcIdentity](#)

The [PlcIdentity](#) to which the [PlcType](#) does refer.

**length** [Int32](#)

The length of the [PlcType](#) which either specifies the total number of elements in an array type or the total number of characters in a string type.

### Returns

[PlcType](#)

The [PlcType](#) which matches with the characteristics supplied.

### Exceptions

[ArgumentException](#)

The **typeCode** is [Empty](#) or **frameworkType** is a not supported framework type or a jagged or multi-dimensional array type or **typeCode** / **frameworkType** can not be used together with the **identity** specified or **identity** does not provide the necessary information required to address the type of data.

[ArgumentNullException](#)

The **frameworkType** or **identity** is a null reference (Nothing in Visual Basic).

[ArgumentOutOfRangeException](#)

The **length** is out of the bounds defined by [MinLength](#) and [MaxLength](#) or [MinLength](#) and [MaxLength](#).

## Of(PlcTypeCode, Type, PlcIdentity, Int32, PlcTypeLayout, IEnumerable<IPlcMemberInfo>)

Retrieves the according [PlcType](#) which matches the supplied type metadata.

## C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, PlcIdentity identity, int length, PlcTypeLayout layout, IEnumerable<IPlcMemberInfo> members)
```

### Parameters

**typeCode** [PlcTypeCode](#)

The [PlcTypeCode](#) of the PLC type represented by the [PlcType](#).

**frameworkType** [Type](#)

The framework [Type](#) represented by the [PlcType](#).

**identity** [PlcIdentity](#)

The [PlcIdentity](#) to which the [PlcType](#) does refer.

**length** [Int32](#)

The length of the [PlcType](#) which either specifies the total number of elements in an array type or the total number of characters in a string type.

**layout** [PlcTypeLayout](#)

An instance of the [PlcTypeLayout](#) class which provides the characteristics to use to absolutely align the [members](#).

**members** [IEnumerable<IPlcMemberInfo>](#)

The [IPlcMemberInfo](#) objects to associate with the [PlcType](#).

### Returns

[PlcType](#)

The [PlcType](#) which matches with the characteristics supplied.

### Exceptions

[ArgumentException](#)

The [typeCode](#) is [Empty](#) or [frameworkType](#) is a not supported framework type or a jagged or multi-dimensional array type or [typeCode](#) / [frameworkType](#) can not be used together with the [identity](#) specified or [identity](#) does not provide the necessary information required to address the type of data.

[ArgumentNullException](#)

The [frameworkType](#), [identity](#), [layout](#) or [members](#) or one of its items is a null reference (Nothing in Visual Basic).

[ArgumentOutOfRangeException](#)

The [length](#) is out of the bounds defined by [MinLength](#) and [MaxLength](#) or [MinLength](#) and [MaxLength](#).

# Of(PlcTypeCode, Type, PlcIdentity, Int32, PlcTypeLayout, IPlcMemberInfo[])

Retrieves the according [PlcType](#) which matches the supplied type metadata.

## C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, PlcIdentity identity, int length, PlcTypeLayout layout, params IPlcMemberInfo[] members)
```

## Parameters

**typeCode** [PlcTypeCode](#)

The [PlcTypeCode](#) of the PLC type represented by the [PlcType](#).

**frameworkType** [Type](#)

The framework [Type](#) represented by the [PlcType](#).

**identity** [PlcIdentity](#)

The [PlcIdentity](#) to which the [PlcType](#) does refer.

**length** [Int32](#)

The length of the [PlcType](#) which either specifies the total number of elements in an array type or the total number of characters in a string type.

**layout** [PlcTypeLayout](#)

An instance of the [PlcTypeLayout](#) class which provides the characteristics to use to absolutely align the [members](#).

**members** [IPlcMemberInfo\[\]](#)

The [IPlcMemberInfo](#) objects to associate with the [PlcType](#).

## Returns

[PlcType](#)

The [PlcType](#) which matches with the characteristics supplied.

## Exceptions

[ArgumentException](#)

The [typeCode](#) is [Empty](#) or [frameworkType](#) is a not supported framework type or a jagged or multi-dimensional array type or [typeCode](#) / [frameworkType](#) can not be used together with the [identity](#) specified or [identity](#) does not provide the necessary information required to address the type of data.

[ArgumentNullException](#)

The [frameworkType](#), [identity](#), [layout](#) or [members](#) or one of its items is a null reference (Nothing in Visual Basic).

## ArgumentOutOfRangeException

The `Length` is out of the bounds defined by `MinLength` and `MaxLength` or `MinLength` and `MaxLength`.

# Of(PlcTypeCode, Type, PlcIdentity, PlcName)

Retrieves the according `PlcType` which matches the supplied type metadata.

## C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, PlcIdentity identity, PlcName name)
```

## Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` of the PLC type represented by the `PlcType`.

`frameworkType` `Type`

The framework `Type` represented by the `PlcType`.

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`name` `PlcName`

The `PlcName` of the `PlcType`.

## Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `typeCode` is `Empty` or `frameworkType` is a not supported framework type or a jagged or multi-dimensional array type or `typeCode` / `frameworkType` can not be used together with the `identity` specified or `identity` does not provide the necessary information required to address the type of data.

### ArgumentNullException

The `frameworkType`, `identity` or `name` is a null reference (Nothing in Visual Basic).

# Of(PlcTypeCode, Type, PlcIdentity, PlcName, Int32)

Retrieves the according `PlcType` which matches the supplied type metadata.

## C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, PlcIdentity identity,
PlcName name, int length)
```

## Parameters

**typeCode** [PlcTypeCode](#)

The [PlcTypeCode](#) of the PLC type represented by the [PlcType](#).

**frameworkType** [Type](#)

The framework [Type](#) represented by the [PlcType](#).

**identity** [PlcIdentity](#)

The [PlcIdentity](#) to which the [PlcType](#) does refer.

**name** [PlcName](#)

The [PlcName](#) of the [PlcType](#).

**length** [Int32](#)

The length of the [PlcType](#) which either specifies the total number of elements in an array type or the total number of characters in a string type.

## Returns

[PlcType](#)

The [PlcType](#) which matches with the characteristics supplied.

## Exceptions

[ArgumentException](#)

The **typeCode** is [Empty](#) or **frameworkType** is a not supported framework type or a jagged or multi-dimensional array type or **typeCode** / **frameworkType** can not be used together with the **identity** specified or **identity** does not provide the necessary information required to address the type of data.

[ArgumentNullException](#)

The **frameworkType**, **identity** or **name** is a null reference (Nothing in Visual Basic).

[ArgumentOutOfRangeException](#)

The **length** is out of the bounds defined by [MinLength](#) and [MaxLength](#) or [MinLength](#) and [MaxLength](#).

# Of(PlcTypeCode, Type, PlcIdentity, PlcName, Int32, PlcTypeLayout, IEnumerable<IPlcMemberInfo>)

Retrieves the according [PlcType](#) which matches the supplied type metadata.

**C#**

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, PlcIdentity identity,
PlcName name, int length, PlcTypeLayout layout, IEnumerable<IPlcMemberInfo> members)
```

## Parameters

**typeCode** [PlcTypeCode](#)

The [PlcTypeCode](#) of the PLC type represented by the [PlcType](#).

**frameworkType** [Type](#)

The framework [Type](#) represented by the [PlcType](#).

**identity** [PlcIdentity](#)

The [PlcIdentity](#) to which the [PlcType](#) does refer.

**name** [PlcName](#)

The [PlcName](#) of the [PlcType](#).

**length** [Int32](#)

The length of the [PlcType](#) which either specifies the total number of elements in an array type or the total number of characters in a string type.

**layout** [PlcTypeLayout](#)

An instance of the [PlcTypeLayout](#) class which provides the characteristics to use to absolutely align the [members](#).

**members** [IEnumerable<IPlcMemberInfo>](#)

The [IPlcMemberInfo](#) objects to associate with the [PlcType](#).

## Returns

[PlcType](#)

The [PlcType](#) which matches with the characteristics supplied.

## Exceptions

[ArgumentException](#)

The [typeCode](#) is [Empty](#) or [frameworkType](#) is a not supported framework type or a jagged or multi-dimensional array type or [typeCode](#) / [frameworkType](#) can not be used together with the [identity](#) specified or [identity](#) does not provide the necessary information required to address the type of data.

[ArgumentNullException](#)

The [frameworkType](#), [identity](#), [layout](#) or [members](#) or one of its items is a null reference (Nothing in Visual Basic).

[ArgumentOutOfRangeException](#)

The [length](#) is out of the bounds defined by [MinLength](#) and [MaxLength](#) or [MinLength](#) and [MaxLength](#).

# Of(PlcTypeCode, Type, PlcIdentity, PlcName, Int32, PlcTypeLayout, IPlcMemberInfo[])

Retrieves the according [PlcType](#) which matches the supplied type metadata.

## C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, PlcIdentity identity, PlcName name, int length, PlcTypeLayout layout, params IPlcMemberInfo[] members)
```

## Parameters

**typeCode** [PlcTypeCode](#)

The [PlcTypeCode](#) of the PLC type represented by the [PlcType](#).

**frameworkType** [Type](#)

The framework [Type](#) represented by the [PlcType](#).

**identity** [PlcIdentity](#)

The [PlcIdentity](#) to which the [PlcType](#) does refer.

**name** [PlcName](#)

The [PlcName](#) of the [PlcType](#).

**length** [Int32](#)

The length of the [PlcType](#) which either specifies the total number of elements in an array type or the total number of characters in a string type.

**layout** [PlcTypeLayout](#)

An instance of the [PlcTypeLayout](#) class which provides the characteristics to use to absolutely align the **members**.

**members** [IPlcMemberInfo\[\]](#)

The [IPlcMemberInfo](#) objects to associate with the [PlcType](#).

## Returns

[PlcType](#)

The [PlcType](#) which matches with the characteristics supplied.

## Exceptions

[ArgumentException](#)

The **typeCode** is [Empty](#) or **frameworkType** is a not supported framework type or a jagged or multi-dimensional array type or **typeCode** / **frameworkType** can not be used together with the **identity** specified or **identity** does not provide the necessary information required to address the type of data.

## ArgumentNullException

The `frameworkType`, `identity`, `name`, `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

## ArgumentOutOfRangeException

The `length` is out of the bounds defined by `MinLength` and `MaxLength` or `MinLength` and `MaxLength`.

# Of(PlcTypeCode, Type, PlcIdentity, PlcName, PlcTypeLayout, IEnumerable<IPlcMemberInfo>)

Retrieves the according `PlcType` which matches the supplied type metadata.

## C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, PlcIdentity identity, PlcName name, PlcTypeLayout layout, IEnumerable<IPlcMemberInfo> members)
```

## Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` of the PLC type represented by the `PlcType`.

`frameworkType` `Type`

The framework `Type` represented by the `PlcType`.

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`name` `PlcName`

The `PlcName` of the `PlcType`.

`layout` `PlcTypeLayout`

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the `members`.

`members` `IEnumerable<IPlcMemberInfo>`

The `IPlcMemberInfo` objects to associate with the `PlcType`.

## Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

## Exceptions

`ArgumentException`

The `typeCode` is `Empty` or `frameworkType` is a not supported framework type or a jagged or multi-dimensional array type or `typeCode` / `frameworkType` can not be used together with the `identity` specified or `identity` does not provide the necessary information required to address the type of data.

### ArgumentNullException

The `frameworkType`, `identity`, `name`, `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

## Of(PlcTypeCode, Type, PlcIdentity, PlcName, PlcTypeLayout, IPlcMemberInfo[])

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, PlcIdentity identity, PlcName name, PlcTypeLayout layout, params IPlcMemberInfo[] members)
```

### Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` of the PLC type represented by the `PlcType`.

`frameworkType` `Type`

The framework `Type` represented by the `PlcType`.

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`name` `PlcName`

The `PlcName` of the `PlcType`.

`layout` `PlcTypeLayout`

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the `members`.

`members` `IPlcMemberInfo[]`

The `IPlcMemberInfo` objects to associate with the `PlcType`.

### Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

### Exceptions

`ArgumentException`

The `typeCode` is `Empty` or `frameworkType` is a not supported framework type or a jagged or multi-dimensional array type or `typeCode` / `frameworkType` can not be used together with the `identity` specified or `identity` does not provide the necessary information required to address the type of data.

### ArgumentNullException

The `frameworkType`, `identity`, `layout` or `name` or `members` or one of its items is a null reference (Nothing in Visual Basic).

## Of(PlcTypeCode, Type, PlcIdentity, PlcTypeLayout, IEnumerable<IPlcMemberInfo>)

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, PlcIdentity identity, PlcTypeLayout layout, IEnumerable<IPlcMemberInfo> members)
```

### Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` of the PLC type represented by the `PlcType`.

`frameworkType` `Type`

The framework `Type` represented by the `PlcType`.

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`layout` `PlcTypeLayout`

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the `members`.

`members` `IEnumerable<IPlcMemberInfo>`

The `IPlcMemberInfo` objects to associate with the `PlcType`.

### Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

### Exceptions

#### ArgumentException

The `typeCode` is `Empty` or `frameworkType` is a not supported framework type or a jagged or multi-dimensional array type or `typeCode` / `frameworkType` can not be used together with the `identity`

specified or `identity` does not provide the necessary information required to address the type of data.

### ArgumentNullException

The `frameworkType`, `identity`, `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

## Of(PlcTypeCode, Type, PlcIdentity, PlcTypeLayout, IPlcMemberInfo[])

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, PlcIdentity identity,
PlcTypeLayout layout, params IPlcMemberInfo[] members)
```

### Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` of the PLC type represented by the `PlcType`.

`frameworkType` `Type`

The framework `Type` represented by the `PlcType`.

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`layout` `PlcTypeLayout`

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the `members`.

`members` `IPlcMemberInfo[]`

The `IPlcMemberInfo` objects to associate with the `PlcType`.

### Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

### Exceptions

#### ArgumentException

The `typeCode` is `Empty` or `frameworkType` is a not supported framework type or a jagged or multi-dimensional array type or `typeCode` / `frameworkType` can not be used together with the `identity` specified or `identity` does not provide the necessary information required to address the type of data.

#### ArgumentNullException

The `frameworkType`, `identity`, `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

## Of(PlcTypeCode, Type, PlcTypeLayout, IEnumerable<IPlcMemberInfo>)

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, PlcTypeLayout layout,
IEnumerable<IPlcMemberInfo> members)
```

### Parameters

`typeCode` `PlcTypeCode`

The `PlcTypeCode` of the PLC type represented by the `PlcType`.

`frameworkType` `Type`

The framework `Type` represented by the `PlcType`.

`layout` `PlcTypeLayout`

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the `members`.

`members` `IEnumerable<IPlcMemberInfo>`

The `IPlcMemberInfo` objects to associate with the `PlcType`.

### Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

### Exceptions

`ArgumentException`

The `typeCode` is `Empty` or `frameworkType` is a not supported framework type or a jagged or multi-dimensional array type.

`ArgumentNullException`

The `frameworkType`, `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

## Of(PlcTypeCode, Type, PlcTypeLayout, IPlcMemberInfo[])

Retrieves the according `PlcType` which matches the supplied type metadata.

## C#

```
public static PlcType Of(PlcTypeCode typeCode, Type frameworkType, PlcTypeLayout layout,  
params IPlcMemberInfo[] members)
```

### Parameters

**typeCode** [PlcTypeCode](#)

The [PlcTypeCode](#) of the PLC type represented by the [PlcType](#).

**frameworkType** [Type](#)

The framework [Type](#) represented by the [PlcType](#).

**layout** [PlcTypeLayout](#)

An instance of the [PlcTypeLayout](#) class which provides the characteristics to use to absolutely align the [members](#).

**members** [IPlcMemberInfo\[\]](#)

The [IPlcMemberInfo](#) objects to associate with the [PlcType](#).

### Returns

[PlcType](#)

The [PlcType](#) which matches with the characteristics supplied.

### Exceptions

[ArgumentException](#)

The [typeCode](#) is [Empty](#) or [frameworkType](#) is a not supported framework type or a jagged or multi-dimensional array type.

[ArgumentNullException](#)

The [frameworkType](#), [layout](#) or [members](#) or one of its items is a null reference (Nothing in Visual Basic).

## Of(Type)

Retrieves the according [PlcType](#) which matches the supplied type metadata.

## C#

```
public static PlcType Of(Type type)
```

### Parameters

**type** [Type](#)

The framework [Type](#) represented by the [PlcType](#).

## Returns

### PlcType

The [PlcType](#) which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The [type](#) is a not supported framework type or a jagged multi-dimensional array type.

### ArgumentNullException

The [type](#) is a null reference (Nothing in Visual Basic).

## Remarks

If [type](#) is a value type then [PlcType](#) will be also a value type. If [type](#) is an array type then [PlcType](#) will be a array type with the length equals zero. The following [PlcType](#) can not constructed using this method: \* [Date](#).

- [Time](#).
- [S5Time](#).

In general specifying [type](#) as a [DateTime](#) will result into a [PlcType](#) with the [DateTime](#) and specifying [type](#) as a [TimeSpan](#) will result into a [PlcType](#) with the [TimeOfDay](#).

# Of(Type, PlcIdentity)

Retrieves the according [PlcType](#) which matches the supplied type metadata.

## C#

```
public static PlcType Of(Type type, PlcIdentity identity)
```

## Parameters

### [type](#) Type

The framework [Type](#) represented by the [PlcType](#).

### [identity](#) PlcIdentity

The [PlcIdentity](#) to which the [PlcType](#) does refer.

## Returns

### PlcType

The [PlcType](#) which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `type` is a not supported framework type or a jagged multi-dimensional array type or it can not be used together with the `identity` specified or `identity` does not provide the necessary information required to address the type of data.

### ArgumentNullException

The `type` or `identity` is a null reference (Nothing in Visual Basic).

## Remarks

If `type` is a value type then `PlcType` will be also a value type. If `type` is an array type then `PlcType` will be a array type with the length equals zero. The following `PlcType` can not constructed using this method: \*  
`Date`.

- `Time`.
- `S5Time`.

In general specifying `type` as a `DateTime` will result into a `PlcType` with the `DateTime` and specifying `type` as a `TimeSpan` will result into a `PlcType` with the `TimeOfDay`.

## Of(Type, PlcIdentity, Int32)

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of(Type type, PlcIdentity identity, int length)
```

### Parameters

#### `type` Type

The framework `Type` represented by the `PlcType`.

#### `identity` PlcIdentity

The `PlcIdentity` to which the `PlcType` does refer.

#### `length` Int32

The length of the `PlcType` which either specifies the total number of elements in an array type or the total number of characters in a string type.

### Returns

#### `PlcType`

The `PlcType` which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `type` is a not supported framework type or a jagged multi-dimensional array type or it can not be used together with the `identity` specified or `identity` does not provide the necessary information required to address the type of data.

### ArgumentNullException

The `type` or `identity` is a null reference (Nothing in Visual Basic).

### ArgumentOutOfRangeException

The `length` is out of the bounds defined by `MinLength` and `MaxLength` or `MinLength` and `MaxLength`.

## Remarks

This method does always construct array types using the `PlcType`. Therefore it is not possible to use the following framework types as the value for `type`: \* `DateTime`.

- `TimeSpan`.
- `PlcObject` or derivate from it.

It is also possible to construct a `PlcType` with the `String` through this method, there `length` does specify the maximum number of characters in the string.

## Of(Type, PlcIdentity, PlcName)

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of(Type type, PlcIdentity identity, PlcName name)
```

### Parameters

#### `type` Type

The framework `Type` represented by the `PlcType`.

#### `identity` PlcIdentity

The `PlcIdentity` to which the `PlcType` does refer.

#### `name` PlcName

The `PlcName` of the `PlcType`.

### Returns

#### `PlcType`

The `PlcType` which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `type` is a not supported framework type or a jagged multi-dimensional array type or it can not be used together with the `identity` specified or `identity` does not provide the necessary information required to address the type of data.

### ArgumentNullException

The `type`, `identity` or `name` is a null reference (Nothing in Visual Basic).

## Remarks

If `type` is a value type then `PlcType` will be also a value type. If `type` is an array type then `PlcType` will be a array type with the length equals zero. The following `PlcType` can not constructed using this method: \*  
`Date`.

- `Time`.
- `S5Time`.

In general specifying `type` as a `DateTime` will result into a `PlcType` with the `DateTime` and specifying `type` as a `TimeSpan` will result into a `PlcType` with the `TimeOfDay`.

## Of(Type, PlcIdentity, PlcName, Int32)

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of(Type type, PlcIdentity identity, PlcName name, int length)
```

### Parameters

#### `type` Type

The framework `Type` represented by the `PlcType`.

#### `identity` PlcIdentity

The `PlcIdentity` to which the `PlcType` does refer.

#### `name` PlcName

The `PlcName` of the `PlcType`.

#### `length` Int32

The length of the `PlcType` which either specifies the total number of elements in an array type or the total number of characters in a string type.

### Returns

#### `PlcType`

The `PlcType` which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `type` is a not supported framework type or a jagged multi-dimensional array type or it can not be used together with the `identity` specified or `identity` does not provide the necessary information required to address the type of data.

### ArgumentNullException

The `type`, `identity` or `name` is a null reference (Nothing in Visual Basic).

### ArgumentOutOfRangeException

The `length` is out of the bounds defined by `MinLength` and `MaxLength` or `MinLength` and `MaxLength`.

## Remarks

This method does always construct array types using the `PlcType`. Therefore it is not possible to use the following framework types as the value for `type`: \* `DateTime`.

- `TimeSpan`.
- `PlcObject` or derivate from it.

It is also possible to construct a `PlcType` with the `String` through this method, there `length` does specify the maximum number of characters in the string.

## Of(Type, PlcIdentity, PlcName, PlcTypeLayout, IEnumerable<IPlcMemberInfo>)

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of(Type type, PlcIdentity identity, PlcName name, PlcTypeLayout layout, IEnumerable<IPlcMemberInfo> members)
```

## Parameters

### `type` Type

The framework `Type` represented by the `PlcType`.

### `identity` PlcIdentity

The `PlcIdentity` to which the `PlcType` does refer.

### `name` PlcName

The `PlcName` of the `PlcType`.

### `layout` PlcTypeLayout

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the `members`.

### `members` IEnumerable<IPlcMemberInfo>

The `IPlcMemberInfo` objects to associate with the `PlcType`.

## Returns

### `PlcType`

The `PlcType` which matches with the characteristics supplied.

## Exceptions

### `ArgumentException`

The `type` is a not supported framework type or a jagged multi-dimensional array type or it can not be used together with the `identity` specified or `identity` does not provide the necessary information required to address the type of data.

### `ArgumentNullException`

The `type`, `identity`, `name`, `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

## Remarks

This method does only construct `PlcType` objects there the `type` is either of the type of `PlcObject` or a derivate of the class.

# Of(Type, PlcIdentity, PlcName, PlcTypeLayout, IPlcMemberInfo[])

Retrieves the according `PlcType` which matches the supplied type metadata.

## C#

```
public static PlcType Of(Type type, PlcIdentity identity, PlcName name, PlcTypeLayout layout, params IPlcMemberInfo[] members)
```

## Parameters

### `type` Type

The framework `Type` represented by the `PlcType`.

### `identity` PlcIdentity

The `PlcIdentity` to which the `PlcType` does refer.

### `name` PlcName

The `PlcName` of the `PlcType`.

### `layout` PlcTypeLayout

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the

`members`.

`members` `IPlcMemberInfo[]`

The `IPlcMemberInfo` objects to associate with the `PlcType`.

## Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

## Exceptions

`ArgumentException`

The `type` is a not supported framework type or a jagged multi-dimensional array type or it can not be used together with the `identity` specified or `identity` does not provide the necessary information required to address the type of data.

`ArgumentNullException`

The `type`, `identity`, `name`, `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

## Remarks

This method does only construct `PlcType` objects there the `type` is either of the type of `PlcObject` or a derivate of the class.

# Of(Type, PlcIdentity, PlcTypeLayout, IEnumerable<IPlcMemberInfo>)

Retrieves the according `PlcType` which matches the supplied type metadata.

## C#

```
public static PlcType Of(Type type, PlcIdentity identity, PlcTypeLayout layout,
IEnumerable<IPlcMemberInfo> members)
```

## Parameters

`type` `Type`

The framework `Type` represented by the `PlcType`.

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`layout` `PlcTypeLayout`

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the

`members`.

`members` `IEnumerable<IPlcMemberInfo>`

The `IPlcMemberInfo` objects to associate with the `PlcType`.

## Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

## Exceptions

`ArgumentException`

The `type` is a not supported framework type or a jagged multi-dimensional array type or it can not be used together with the `identity` specified or `identity` does not provide the necessary information required to address the type of data.

`ArgumentNullException`

The `type`, `identity`, `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

## Remarks

This method does only construct `PlcType` objects there the `type` is either of the type of `PlcObject` or a derivate of the class.

# Of(Type, PlcIdentity, PlcTypeLayout, IPlcMemberInfo[])

Retrieves the according `PlcType` which matches the supplied type metadata.

## C#

```
public static PlcType Of(Type type, PlcIdentity identity, PlcTypeLayout layout, params
IPlcMemberInfo[] members)
```

## Parameters

`type` `Type`

The framework `Type` represented by the `PlcType`.

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`layout` `PlcTypeLayout`

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the `members`.

`members` `IPlcMemberInfo[]`

The [IPlcMemberInfo](#) objects to associate with the [PlcType](#).

## Returns

[PlcType](#)

The [PlcType](#) which matches with the characteristics supplied.

## Exceptions

[ArgumentException](#)

The [type](#) is a not supported framework type or a jagged multi-dimensional array type or it can not be used together with the [identity](#) specified or [identity](#) does not provide the necessary information required to address the type of data.

[ArgumentNullException](#)

The [type](#), [identity](#), [layout](#) or [members](#) or one of its items is a null reference (Nothing in Visual Basic).

## Remarks

This method does only construct [PlcType](#) objects there the [type](#) is either of the type of [PlcObject](#) or a derivate of the class.

# Of(Type, PlcTypeLayout, IEnumerable<IPlcMemberInfo>)

Retrieves the according [PlcType](#) which matches the supplied type metadata.

## C#

```
public static PlcType Of(Type type, PlcTypeLayout layout, IEnumerable<IPlcMemberInfo> members)
```

## Parameters

[type](#) [Type](#)

The framework [Type](#) represented by the [PlcType](#).

[layout](#) [PlcTypeLayout](#)

An instance of the [PlcTypeLayout](#) class which provides the characteristics to use to absolutely align the [members](#).

[members](#) [IEnumerable<IPlcMemberInfo>](#)

The [IPlcMemberInfo](#) objects to associate with the [PlcType](#).

## Returns

[PlcType](#)

The `PlcType` which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `type` is a not supported framework type or a jagged multi-dimensional array type.

### ArgumentNullException

The `type`, `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

## Remarks

This method does only construct `PlcType` objects there the `type` is either of the type of `PlcObject` or a derivate of the class.

## Of(Type, PlcTypeLayout, IPlcMemberInfo[])

Retrieves the according `PlcType` which matches the supplied type metadata.

## C#

```
public static PlcType Of(Type type, PlcTypeLayout layout, params IPlcMemberInfo[] members)
```

## Parameters

### type Type

The framework `Type` represented by the `PlcType`.

### layout PlcTypeLayout

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the `members`.

### members IPlcMemberInfo[]

The `IPlcMemberInfo` objects to associate with the `PlcType`.

## Returns

### PlcType

The `PlcType` which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `type` is a not supported framework type or a jagged multi-dimensional array type.

## ArgumentNullException

The **type**, **layout** or **members** or one of its items is a null reference (Nothing in Visual Basic).

### Remarks

This method does only construct **PlcType** objects there the **type** is either of the type of **PlcObject** or a derivate of the class.

## Of<T>()

Retrieves the according **PlcType** which matches the supplied type metadata.

### C#

```
public static PlcType Of<T>()
```

### Returns

**PlcType**

The **PlcType** which matches with the characteristics supplied.

### Remarks

If **T** is a value type then **PlcType** will be also a value type. If **T** is an array type then **PlcType** will be a array type with the length equals zero. The following **PlcType** can not constructed using this method: \* **Date**.

- **Time**.
- **S5Time**.

In general specifying **T** as a **DateTime** will result into a **PlcType** with the **DateTime** and specifying **T** as a **TimeSpan** will result into a **PlcType** with the **TimeOfDay**.

## Of<T>(PlcIdentity)

Retrieves the according **PlcType** which matches the supplied type metadata.

### C#

```
public static PlcType Of<T>(PlcIdentity identity)
```

### Parameters

**identity** **PlcIdentity**

The **PlcIdentity** to which the **PlcType** does refer.

### Returns

**PlcType**

The `PlcType` which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `identity` can not be used together with `T` specified or `identity` does not provide the necessary information required to address the type of data.

### ArgumentNullException

The `identity` is a null reference (Nothing in Visual Basic).

## Remarks

If `T` is a value type then `PlcType` will be also a value type. If `T` is an array type then `PlcType` will be a array type with the length equals zero. The following `PlcType` can not constructed using this method: \* `Date`.

- `Time`.
- `S5Time`.

In general specifying `T` as a `DateTime` will result into a `PlcType` with the `DateTime` and specifying `T` as a `TimeSpan` will result into a `PlcType` with the `TimeOfDay`.

## Of<T>(PlcIdentity, Int32)

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of<T>(PlcIdentity identity, int length)
```

## Parameters

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`length` `Int32`

The length of the `PlcType` which either specifies the total number of elements in an array type or the total number of characters in a string type.

## Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

## Exceptions

## ArgumentException

The `identity` can not be used together with `T` specified or `identity` does not provide the necessary information required to address the type of data.

## ArgumentNullException

The `identity` is a null reference (Nothing in Visual Basic).

## ArgumentOutOfRangeException

The `length` is out of the bounds defined by `MinLength` and `MaxLength` or `MinLength` and `MaxLength`.

## Remarks

This method does always construct array types using the `PlcType`. Therefore it is not possible to use the following framework types as the value for `T`: \* `DateTime`.

- `TimeSpan`.
- `PlcObject` or derivate from it.

It is also possible to construct a `PlcType` with the `String` through this method, there `length` does specify the maximum number of characters in the string.

# Of<T>(PlcIdentity, PlcName)

Retrieves the according `PlcType` which matches the supplied type metadata.

## C#

```
public static PlcType Of<T>(PlcIdentity identity, PlcName name)
```

## Parameters

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`name` `PlcName`

The `PlcName` of the `PlcType`.

## Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

## Exceptions

### ArgumentException

The `identity` can not be used together with `T` specified or `identity` does not provide the necessary information required to address the type of data.

## ArgumentNullException

The `identity` or `name` is a null reference (Nothing in Visual Basic).

### Remarks

If `T` is a value type then `PlcType` will be also a value type. If `T` is an array type then `PlcType` will be a array type with the length equals zero. The following `PlcType` can not constructed using this method: \* `Date`.

- `Time`.
- `S5Time`.

In general specifying `T` as a `DateTime` will result into a `PlcType` with the `DateTime` and specifying `T` as a `TimeSpan` will result into a `PlcType` with the `TimeOfDay`.

## Of<T>(PlcIdentity, PlcName, Int32)

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of<T>(PlcIdentity identity, PlcName name, int length)
```

### Parameters

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`name` `PlcName`

The `PlcName` of the `PlcType`.

`length` `Int32`

The length of the `PlcType` which either specifies the total number of elements in an array type or the total number of characters in a string type.

### Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

### Exceptions

`ArgumentException`

The `identity` can not be used together with `T` specified or `identity` does not provide the necessary information required to address the type of data.

`ArgumentNullException`

The `identity` or `name` is a null reference (Nothing in Visual Basic).

## ArgumentOutOfRangeException

The `Length` is out of the bounds defined by `MinLength` and `MaxLength` or `MinLength` and `MaxLength`.

### Remarks

This method does always construct array types using the `PlcType`. Therefore it is not possible to use the following framework types as the value for `T`: \* `DateTime`.

- `TimeSpan`.
- `PlcObject` or derivate from it.

It is also possible to construct a `PlcType` with the `String` through this method, there `length` does specify the maximum number of characters in the string.

## Of<T>(PlcIdentity, PlcName, PlcTypeLayout, IEnumerable<IPlcMemberInfo>)

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of<T>(PlcIdentity identity, PlcName name, PlcTypeLayout layout,
    IEnumerable<IPlcMemberInfo> members)
```

### Parameters

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`name` `PlcName`

The `PlcName` of the `PlcType`.

`layout` `PlcTypeLayout`

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the `members`.

`members` `IEnumerable<IPlcMemberInfo>`

The `IPlcMemberInfo` objects to associate with the `PlcType`.

### Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

### Exceptions

`ArgumentException`

The `identity` can not be used together with `T` specified or `identity` does not provide the necessary information required to address the type of data.

### ArgumentNullException

The `identity`, `name`, `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

### Remarks

This method does only construct `PlcType` objects there the `T` is either of the type of `PlcObject` or a derivate of the class.

## Of<T>(PlcIdentity, PlcName, PlcTypeLayout, IPlcMemberInfo[])

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of<T>(PlcIdentity identity, PlcName name, PlcTypeLayout layout, params IPlcMemberInfo[] members)
```

### Parameters

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`name` `PlcName`

The `PlcName` of the `PlcType`.

`layout` `PlcTypeLayout`

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the `members`.

`members` `IPlcMemberInfo[]`

The `IPlcMemberInfo` objects to associate with the `PlcType`.

### Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

### Exceptions

`ArgumentException`

The `identity` can not be used together with `T` specified or `identity` does not provide the necessary information required to address the type of data.

## ArgumentNullException

The `identity`, `name`, `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

### Remarks

This method does only construct `PlcType` objects there the `T` is either of the type of `PlcObject` or a derivate of the class.

## Of<T>(PlcIdentity, PlcTypeLayout, IEnumerable<IPlcMemberInfo>)

Retrieves the according `PlcType` which matches the supplied type metadata.

### C#

```
public static PlcType Of<T>(PlcIdentity identity, PlcTypeLayout layout,
    IEnumerable<IPlcMemberInfo> members)
```

### Parameters

`identity` `PlcIdentity`

The `PlcIdentity` to which the `PlcType` does refer.

`layout` `PlcTypeLayout`

An instance of the `PlcTypeLayout` class which provides the characteristics to use to absolutely align the `members`.

`members` `IEnumerable<IPlcMemberInfo>`

The `IPlcMemberInfo` objects to associate with the `PlcType`.

### Returns

`PlcType`

The `PlcType` which matches with the characteristics supplied.

### Exceptions

#### ArgumentException

The `identity` can not be used together with `T` specified or `identity` does not provide the necessary information required to address the type of data.

#### ArgumentNullException

The `identity`, `layout` or `members` or one of its items is a null reference (Nothing in Visual Basic).

### Remarks

This method does only construct [PlcType](#) objects there the **T** is either of the type of [PlcObject](#) or a derivate of the class.

## Of<T>(PlcIdentity, PlcTypeLayout, IPlcMemberInfo[])

Retrieves the according [PlcType](#) which matches the supplied type metadata.

### C#

```
public static PlcType Of<T>(PlcIdentity identity, PlcTypeLayout layout, params  
IPlcMemberInfo[] members)
```

### Parameters

**identity** [PlcIdentity](#)

The [PlcIdentity](#) to which the [PlcType](#) does refer.

**layout** [PlcTypeLayout](#)

An instance of the [PlcTypeLayout](#) class which provides the characteristics to use to absolutely align the **members**.

**members** [IPlcMemberInfo\[\]](#)

The [IPlcMemberInfo](#) objects to associate with the [PlcType](#).

### Returns

[PlcType](#)

The [PlcType](#) which matches with the characteristics supplied.

### Exceptions

[ArgumentException](#)

The **identity** can not be used together with **T** specified or **identity** does not provide the necessary information required to address the type of data.

[ArgumentNullException](#)

The **identity**, **layout** or **members** or one of its items is a null reference (Nothing in Visual Basic).

### Remarks

This method does only construct [PlcType](#) objects there the **T** is either of the type of [PlcObject](#) or a derivate of the class.

## Of<T>(PlcTypeLayout, IEnumerable<IPlcMemberInfo>)

Retrieves the according [PlcType](#) which matches the supplied type metadata.

## C#

```
public static PlcType Of<T>(PlcTypeLayout layout, IEnumerable<IPlcMemberInfo> members)
```

### Parameters

**layout** [PlcTypeLayout](#)

An instance of the [PlcTypeLayout](#) class which provides the characteristics to use to absolutely align the **members**.

**members** [IEnumerable<IPlcMemberInfo>](#)

The [IPlcMemberInfo](#) objects to associate with the [PlcType](#).

### Returns

[PlcType](#)

The [PlcType](#) which matches with the characteristics supplied.

### Exceptions

[ArgumentNullException](#)

The **layout** or **members** or one of its items is a null reference (Nothing in Visual Basic).

### Remarks

This method does only construct [PlcType](#) objects there the **T** is either of the type of [PlcObject](#) or a derivate of the class.

## Of<T>(PlcTypeLayout, IPlcMemberInfo[])

Retrieves the according [PlcType](#) which matches the supplied type metadata.

## C#

```
public static PlcType Of<T>(PlcTypeLayout layout, params IPlcMemberInfo[] members)
```

### Parameters

**layout** [PlcTypeLayout](#)

An instance of the [PlcTypeLayout](#) class which provides the characteristics to use to absolutely align the **members**.

**members** [IPlcMemberInfo\[\]](#)

The [IPlcMemberInfo](#) objects to associate with the [PlcType](#).

## Returns

### PlcType

The [PlcType](#) which matches with the characteristics supplied.

## Exceptions

### ArgumentNullException

The [Layout](#) or [members](#) or one of its items is a null reference (Nothing in Visual Basic).

## Remarks

This method does only construct [PlcType](#) objects there the **T** is either of the type of [PlcObject](#) or a derivate of the class.

# Relocate(Int32)

Relocates the [PlcType](#) using the specified offset.

## C#

```
public PlcType Relocate(int operandNumber)
```

## Parameters

[operandNumber](#) [Int32](#)

The operand number offset used to adjust the [Address](#).

## Returns

### PlcType

A new instance of the [PlcType](#) configured with the same metadata as this instance but relocated using the specified offset.

## Exceptions

### ArgumentOutOfRangeException

The offset specified by [operandNumber](#) result into a new value that would be out of the bounds defined by [MinOperandNumber](#) or [MaxOperandNumber](#).

### InvalidOperationException

It is not possible to relocate relative types (see [IsAbsolute](#) property).

# Relocate(Int32, Int32)

Relocates the [PlcType](#) using the specified offset.

## C#

```
public PlcType Relocate(int operandNumber, int byteNumber)
```

## Parameters

**operandNumber** [Int32](#)

The operand number offset used to adjust the [Address](#).

**byteNumber** [Int32](#)

The byte number offset used to adjust the [Address](#).

## Returns

[PlcType](#)

A new instance of the [PlcType](#) configured with the same metadata as this instance but relocated using the specified offset.

## Exceptions

[ArgumentOutOfRangeException](#)

One of the offsets specified by **operandNumber** or **byteNumber** result into a new value that would be out of the bounds defined by [MinOperandNumber](#), [MaxOperandNumber](#), [MinByteNumber](#) and [MaxByteNumber](#).

[InvalidOperationException](#)

It is not possible to relocate relative types (see [IsAbsolute](#) property).

# Relocate(Int32, Int32, Int32)

Relocates the [PlcType](#) using the specified offset.

## C#

```
public PlcType Relocate(int operandNumber, int byteNumber, int bitNumber)
```

## Parameters

**operandNumber** [Int32](#)

The operand number offset used to adjust the [Address](#).

**byteNumber** [Int32](#)

The byte number offset used to adjust the [Address](#).

## bitNumber Int32

The bit number offset used to adjust the [Address](#).

## Returns

### PlcType

A new instance of the [PlcType](#) configured with the same metadata as this instance but relocated using the specified offset.

## Exceptions

### ArgumentOutOfRangeException

One of the offsets specified by [operandNumber](#), [byteNumber](#) or [bitNumber](#) result into a new value that would be out of the bounds defined by [MinOperandNumber](#), [MaxOperandNumber](#), [MinByteNumber](#), [MaxByteNumber](#), [MinBitNumber](#) or [MaxBitNumber](#).

### InvalidOperationException

It is not possible to relocate relative types (see [IsAbsolute](#) property).

# Relocate(PlcAddress)

Relocates the [PlcType](#) using the specified [address](#).

## C#

```
public PlcType Relocate(PlcAddress address)
```

## Parameters

### address PlcAddress

The [PlcAddress](#) to that the type is to be relocated.

## Returns

### PlcType

A new instance of the [PlcType](#) configured with the same metadata as this instance but relocated using the specified [address](#).

## Exceptions

### ArgumentNullException

The [address](#) is a null reference (Nothing in Visual Basic).

### ArgumentException

The `address` does not refer to the same `PlcRawType` as this `PlcType`.

### InvalidOperationException

It is not possible to relocate absolute object types without relative type information.

### Remarks

The `RawType` of the `address` specified needs to be the same as defined by the `Address` of the PLC type.

## ToString()

Returns a `String` representing the framework type name and the address range of the current `PlcType`.

### C#

```
public override string ToString()
```

### Returns

#### String

A `String` representing the framework type name and address range of the current `PlcType`.
